

NATHANWPYLE

# Introduction to Programming (DDIT & GBI)

August 28, 2019

Lecturers:

Helge Pfeiffer, [ropf@itu.dk](mailto:ropf@itu.dk)

Martin Aumüller, [maau@itu.dk](mailto:maau@itu.dk)

# Overview

- Organizational
  - Who are we
  - Content
  - Organization and Style
  - Credits
  - Mandatory Assignments
  - Exam
- Content
  - A brief introduction to programming and Python

# Who are we?

- Lecturers
  - Martin Aumüller ([maau@itu.dk](mailto:maau@itu.dk)), 4B05
  - Helge Pfeiffer ([ropf@itu.dk](mailto:ropf@itu.dk)), 4C03
- Teaching Assistants

# Who are you? (CHANGE TO MENTIMETER)

1. Who of you went to school in Denmark?
2. Who of you has programming experience?
3. Who of you thinks programming is difficult?

# Contents of the course (Intended learning outcomes)

After the course, the student is able to

- **analyse** a given, simple computational **task** such as manipulation of a text-based database or external hardware device **to the extent of designing a programmatic solution** and **implementing** it in a modern, text-base, domain-neutral programming language
- **test the correctness** of a piece of code
- **write** program **documentation**
- **reason about** the computational **complexity** of an algorithm
- **express functionality** in terms of abstract data type or application programming interface
- **use text-based tools** of program developement, including an editor and command-line tools

# Organization and Style

- Course webpage on learnIT (<https://learnit.itu.dk/course/view.php?id=3018513>)
- 14 lectures
- use the forum on learnIT for questions of all kinds
- 10-12: Lecture on the topic of the week
- 12-14: Exercise sessions
- Screencasts of lectures available on learnIT

The screenshot shows the learnIT course page for 'Introduction to Programming (Autumn 2019) - B-GBI & B-DDIT'. The page includes a sidebar with links to 'Lecture 1' through 'Lecture 6', and a main content area featuring the book cover for 'Automate the Boring Stuff with Python' by Al Sweigart.

This is the course webpage for Introduction to Programming for the autumn semester of 2019. We will be using the book *Automate the boring stuff* by Al

Course description for B-GBI: BBINPRO1KU  
Course description for B-DDIT: BAINPRO1KU

Use this forum to post questions and eras answers to any questions you might have. Don't hesitate to ask, but don't forget to look if someone else already posted your question.

Introduction to Programming (Autumn 2019)  
– B-GBI & B-DDIT

This is the course webpage for Introduction to Programming for the autumn semester of 2019. We will be using the book *Automate the boring stuff* by Al

<https://learnit.itu.dk/course/view.php?id=3018513>

# Exercises

- You work in groups  
(see groups on learnIT)
- Each room has TAs that will help you with all of your questions

# Structure of exercises

- no blackboard-style instruction
- you work on solving exercises, usually from the book
- work in your group
- try to find help in your group, if this fails contact a TA
- solutions are made available after the exercise session

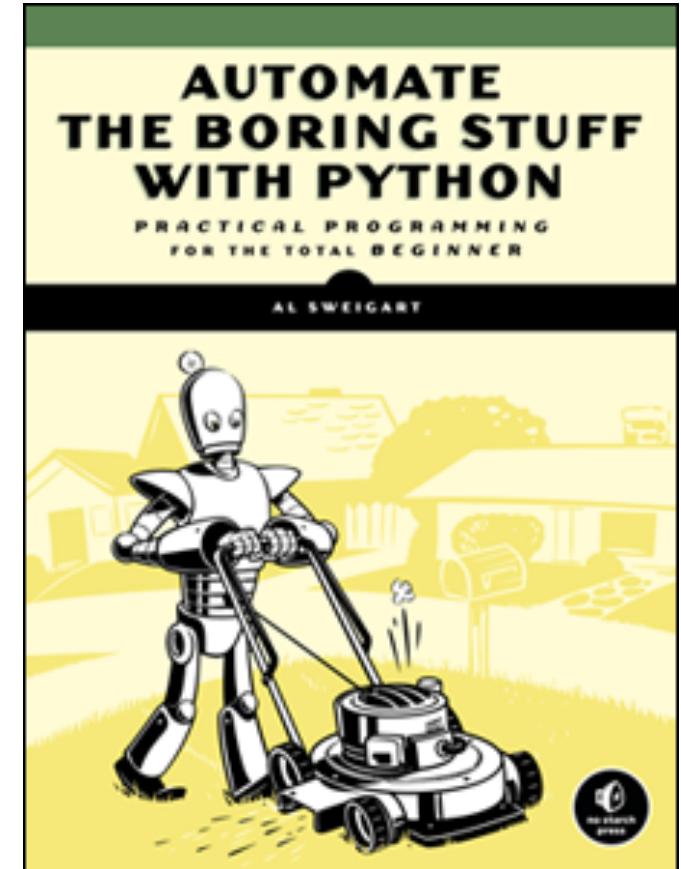

# Additional help through Study Assistance

*Start in Week 3!*

# Book

- We will be using “*Automate the boring stuff*” by Al Sweigart
- Free to read:  
<https://automatetheboringstuff.com/>
- Follow progression relatively closely
- Rule of Thumb: One chapter per week
- Additional material at the end

# Credits

- 7.5 ECTS translate to 11.5 hours/week
- 4 hours lecture/exercises
- Whole work-day from 9am to 5 pm (excl. lunch) on your own!
- Preparing for the exam will take some time as well

# Mandatory assignments

- During the semester, **5 programming assignments** will be set
- **At least 4** of these **must be approved** to qualify for the exam
- You are **allowed to work in the groups**, but **hand-in is individual**
  
- Assignment is posted two weeks before it is due
- Handing in solution on learnIT, always on a Monday, 23:59
- Details will be discussed when the first hand-in is posted
- Current plan: Hand-in on Sept 16, Sept 30, Oct 21, Nov 4, Nov 18

# Exam

- Written, individual exam on January 8, 2019
- 4 hours exam on premises at computers not connected to the internet.
- Test exams on learnIT
- **Focus:** Show that you learned the technical skills to solve programming tasks

# Questions?

# Introduction to Programming

(for real)

# Why learn programming?

## Career Prospects

The competencies of Global Business Informatics from a global perspective of the programme prepares you for a Danish and global/international context, working as:

- Project coordinator
- Process analyst
- Quality professional
- IT architect
- Support Chain Manager
- Business developer

<https://en.itu.dk/programmes/bsc-programmes/global-business-informatics>

## Career Prospects

The competences you acquire during your studies for the BSc in Digital Design and Interactive Technologies and the global perspective of the programme prepare you for a career in both a Danish and an international context. The courses in the programme support and develop your competences in subjects that are attractive on a global job market, for example Scandinavian approaches to co-design, and democratic media formats and work organisations.

<https://en.itu.dk/programmes/bsc-programmes/digital-design-and-interactive-technologies>

Your new super power!  
(automation & speed up)

Prerequisite for technical courses at ITU

Understand possibilities & limitations of IT systems

You can work as e.g.:

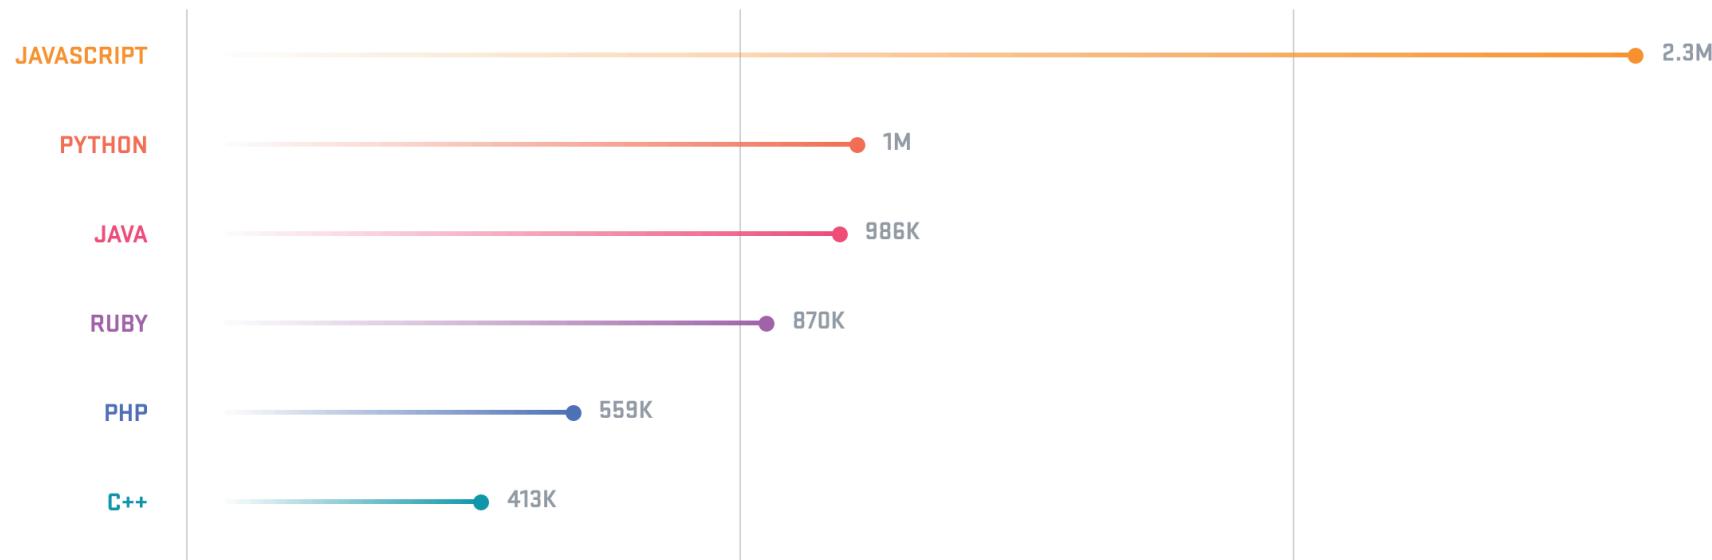

- Interaction designer
- Usability consultant
- Information architect
- Project coordinator

# Why learn Python?

## The fifteen most popular languages on GitHub

by opened pull request

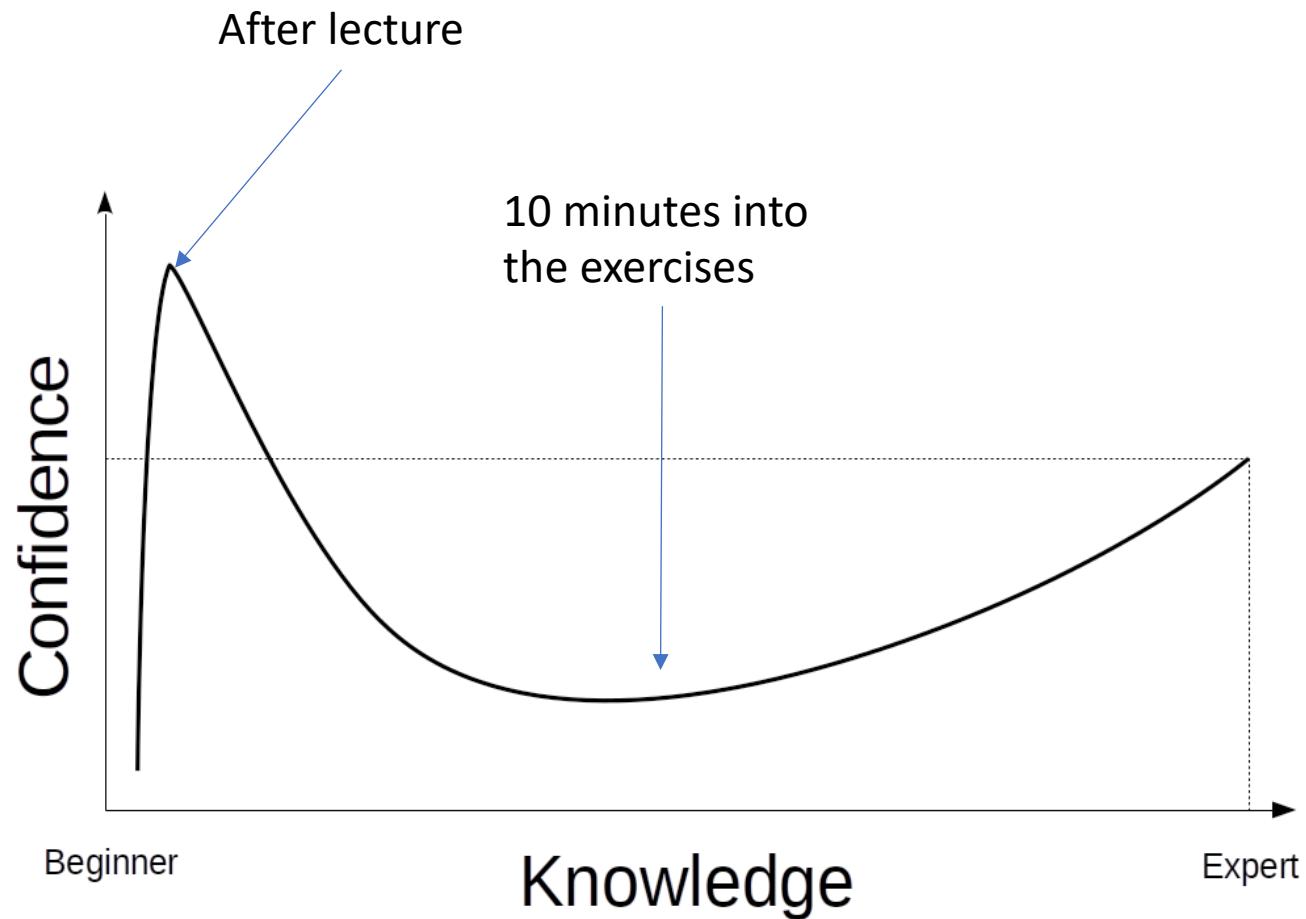

GitHub is home to open source projects written in 337 unique programming languages—but especially JavaScript.

<https://octoverse.github.com/>

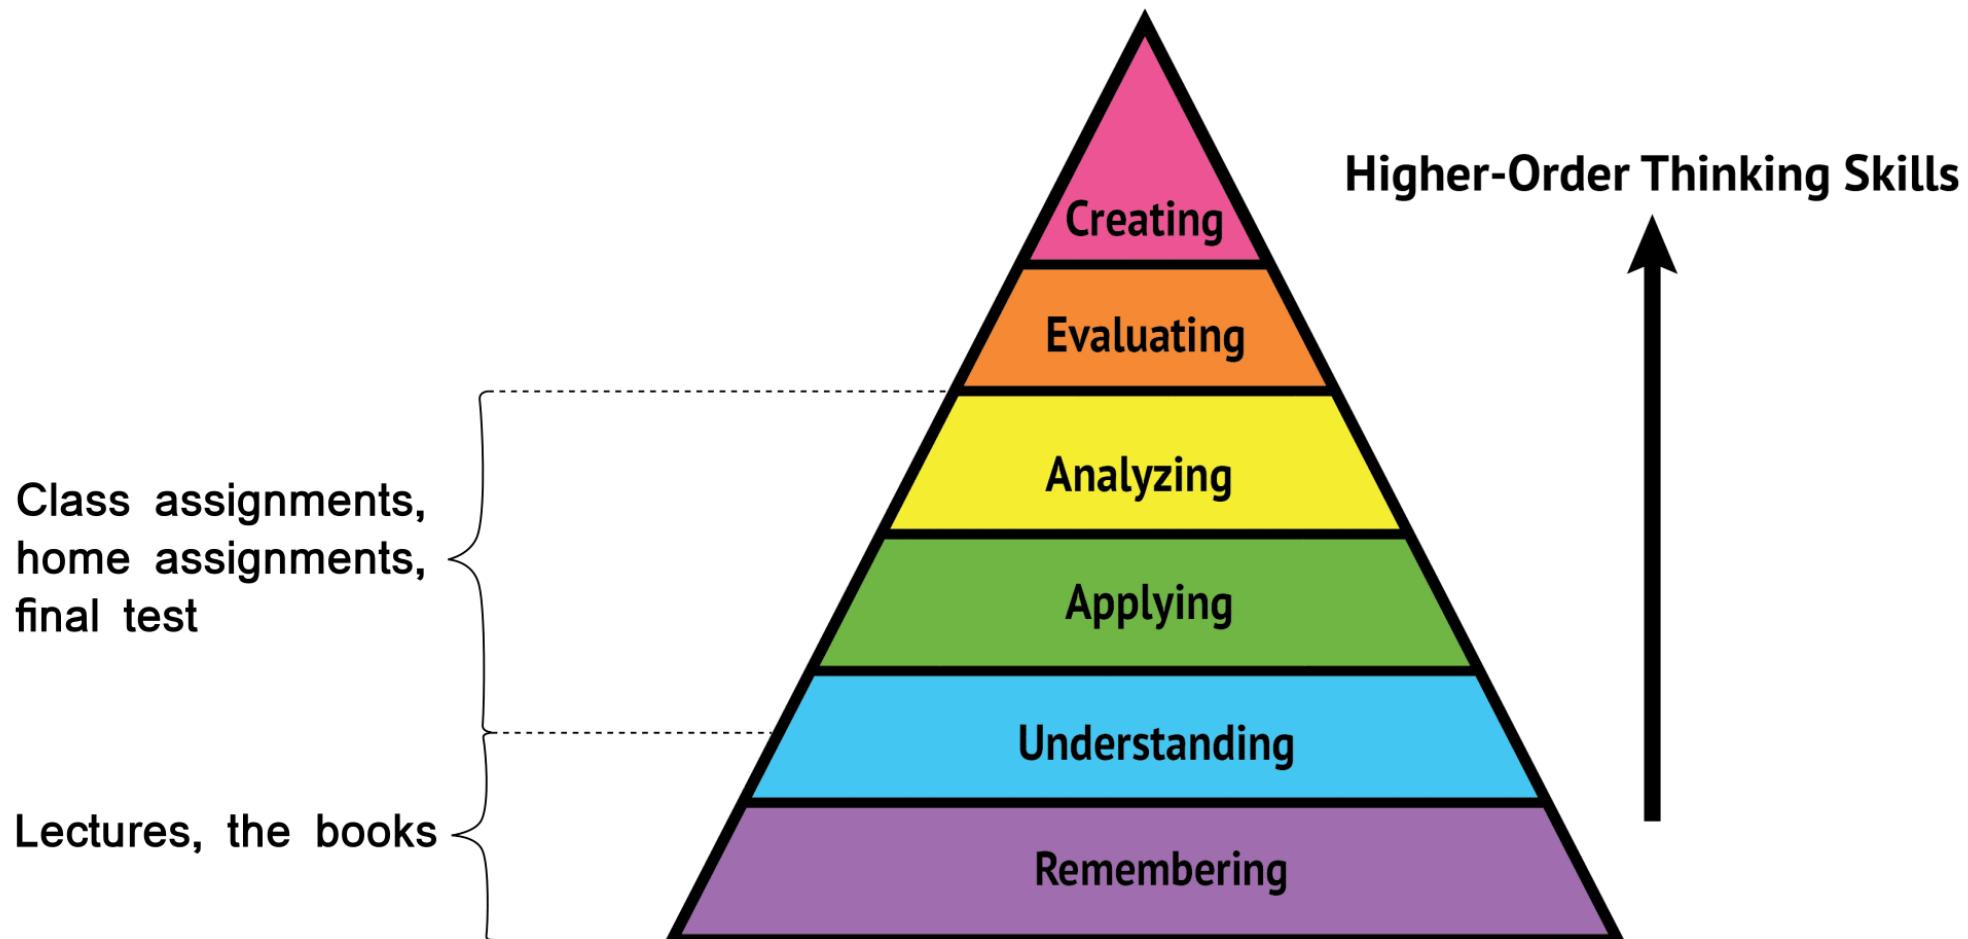

# Beware: It's difficult!

# Beware: It's frustrating

# Bloom's taxonomy

# What is programming?

- Programming is the act of entering instructions for the computer to perform
- Building blocks: **Basic instructions**, for example (in English):
  - “Do this; then do that”
  - “If this condition is true, perform this action; otherwise, do that action”
  - “Do this action a number of times”
  - “Keep doing this until this condition is true”

# An example

```
1 passwordFile = open('SecretPasswordFile.txt')
2 secretPassword = passwordFile.read()
3 print('Enter your password.')
4 typedPassword = input()
5 if typedPassword == secretPassword:
6     print('Access granted')
7 else:
8     print('Access denied')
```

- Read from top to bottom
- Even without prior programming experiences, you can probably make a reasonable guess what this code is doing!

# An example

```
1 passwordFile = open('SecretPasswordFile.txt')
2 secretPassword = passwordFile.read()
3 print('Enter your password.')
4 typedPassword = input()
5 if typedPassword == secretPassword:
6     print('Access granted')
7 else:
8     print('Access denied')
```

1. Open the file “SecretPasswordFile.txt”, this is stored on a computer
2. Read the secret password from the file
3. Prompt the user to enter his/her password
4. Store the typed in password
5. The program checks whether the two passwords match
6. It prints “Access granted” on the screen if they do
7. Otherwise..
8. It prints “Access denied”

# Programmers don't need to know much Math

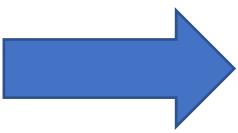

- Most programming doesn't require Math skills beyond basic arithmetic
- It's more like solving a Sudoku puzzle
- Just because it involves numbers doesn't mean you have to be good at Math
- Both Sudoku and Programming involves breaking down a problem into individual, detailed steps.
- Like for all skills: The more you do it, the better you will become

# It's a creative task!

(but you don't need to go to the store to buy new bricks,  
everything is already in your computer)

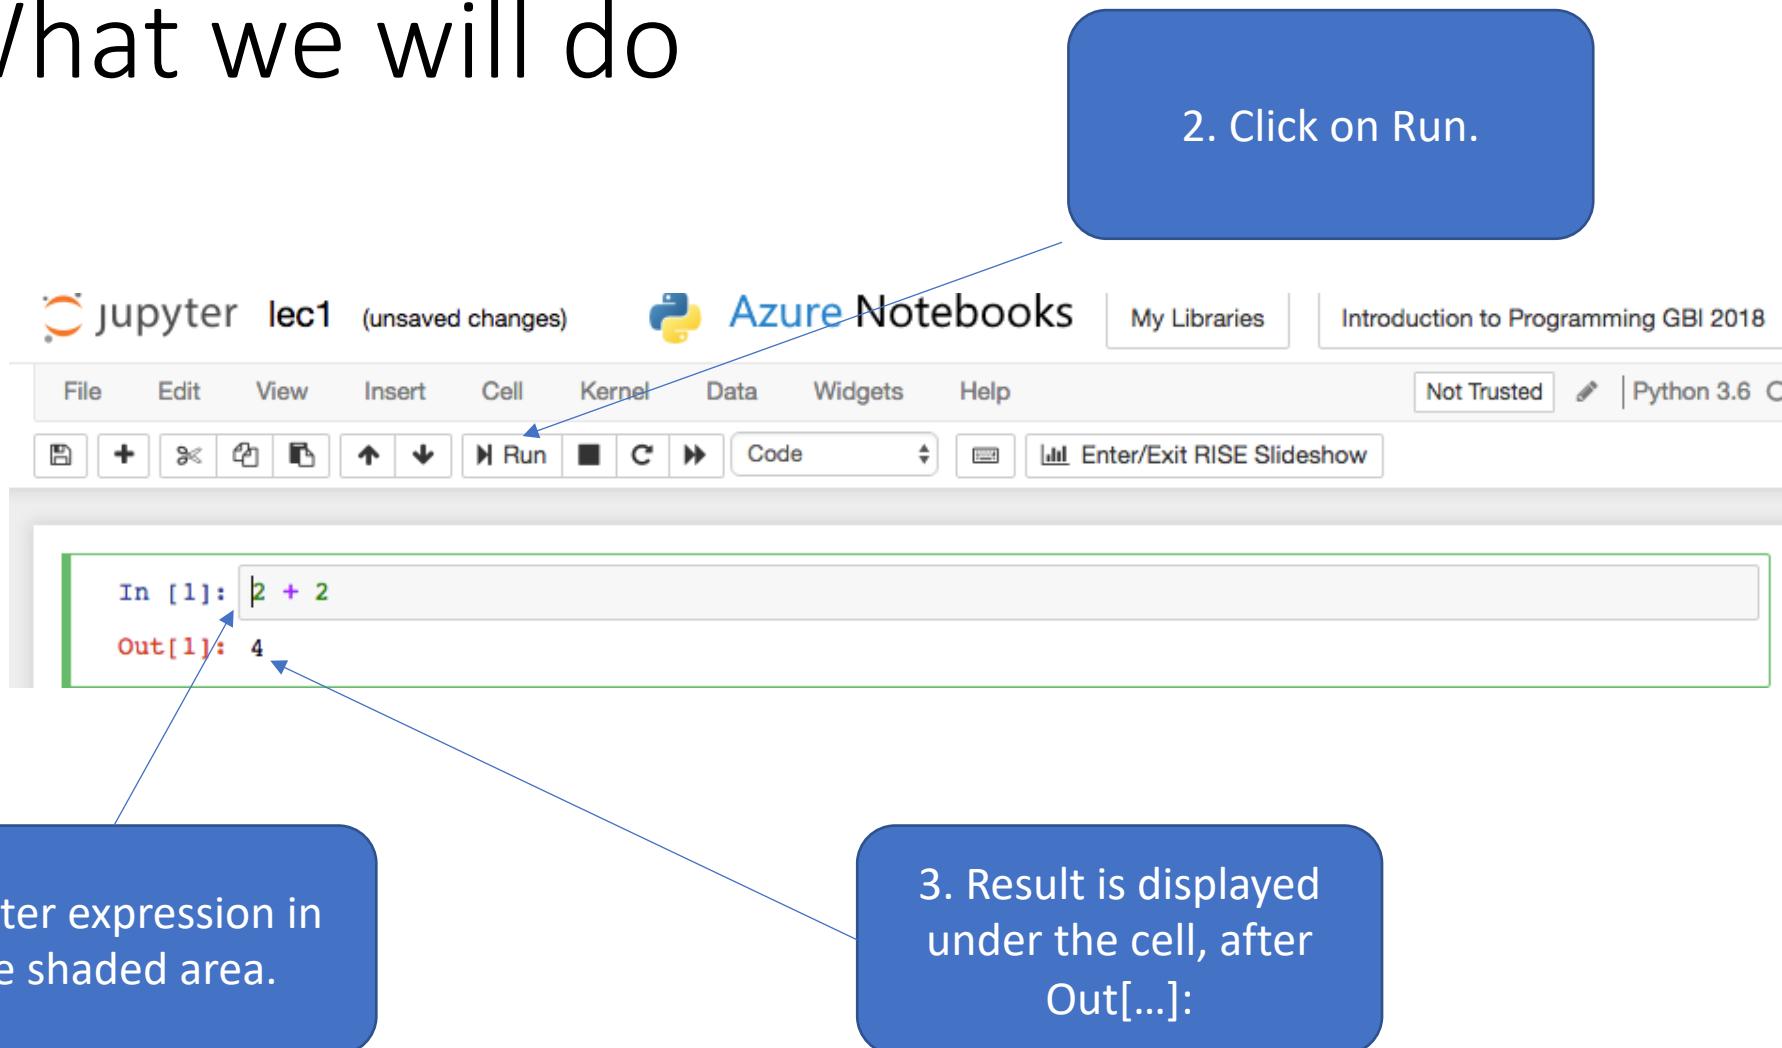

# Python Programming Basics

# Running Python Programs

- Running Python programs requires
  - A working Python installation
  - An editor to write your Python code
- Goal of first exercise session
  - Get a working Python installation and write your first program
- In class
  - Editor is ‘Jupyter notebook’
  - comes with great advantages, but many disadvantages for the beginner

# What we will do

1. Enter expression in  
the shaded area.

2. Click on Run.

3. Result is displayed  
under the cell, after  
Out[...]:

# What you *should* do

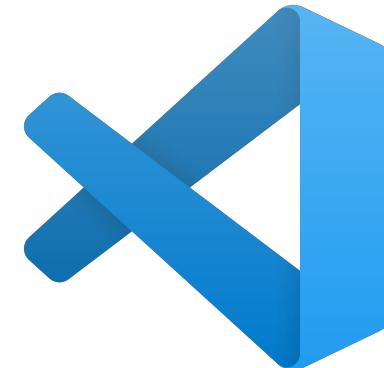

- Use the **Mu editor**

<https://codewith.mu/>

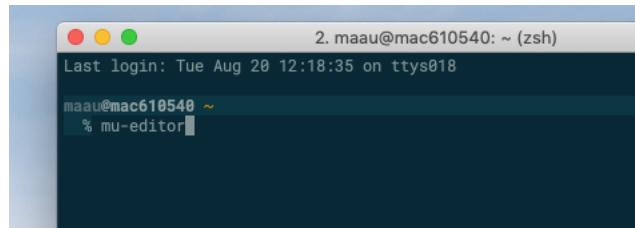

Install as described on learnIT!

- If you get used to programming
  - choose whichever editor you like
  - we will probably switch to VSCode

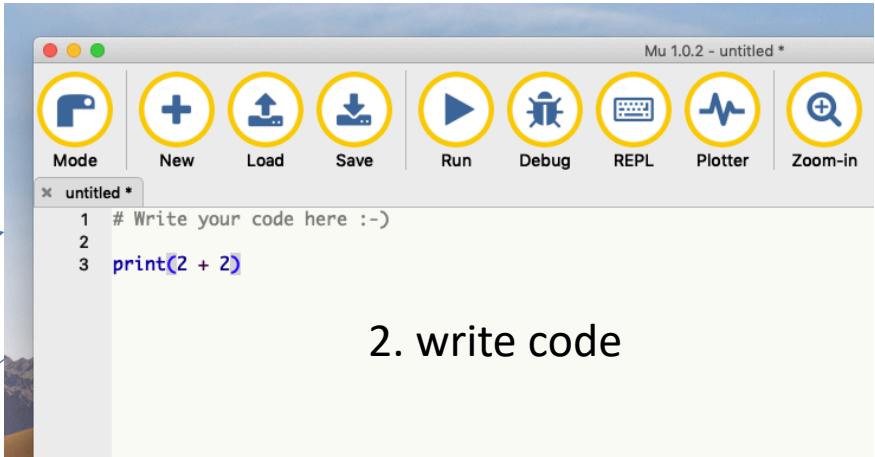

<https://code.visualstudio.com/>

# Workflow with Mu

```
2. maau@mac610540: ~ (zsh)
Last login: Tue Aug 20 12:18:35 on ttys018
maau@mac610540 ~
% mu-editor
```

1. start mu-editor from terminal  
(see learnIT)

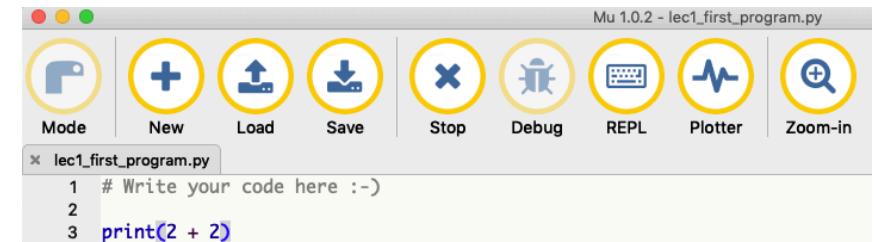

Mu 1.0.2 - untitled \*

Mode New Load Save Run Debug REPL Plotter Zoom-in

untitled \*

```
1 # Write your code here :-
2
3 print(2 + 2)
```

2. write code

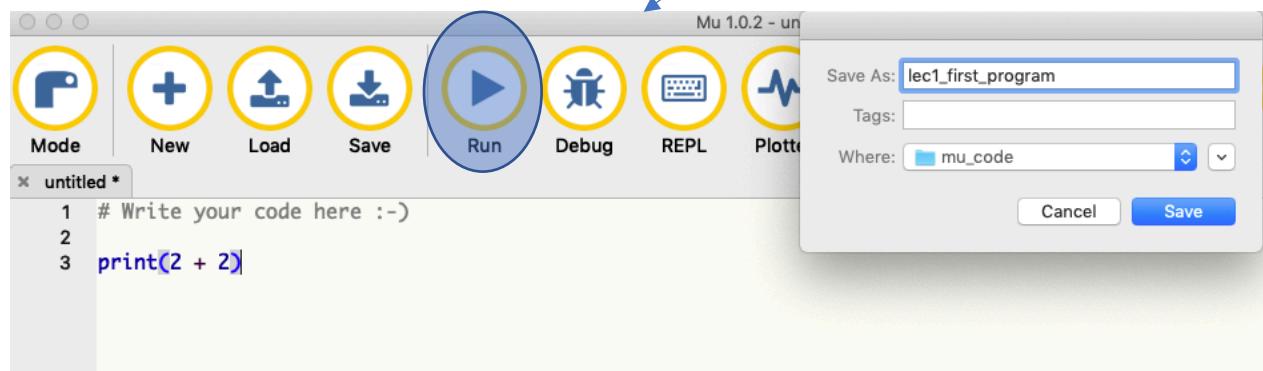

Mu 1.0.2 - lec1\_first\_program.py

Mode New Load Save Stop Debug REPL Plotter Zoom-in

lec1\_first\_program.py

```
1 # Write your code here :-
2
3 print(2 + 2)
```

3. click run, save document

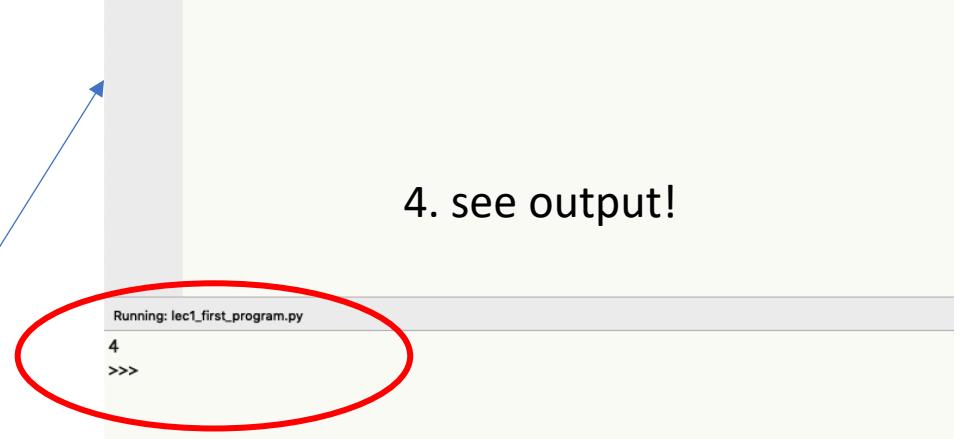

Mu 1.0.2 - un

Mode New Load Save Run Debug REPL Plotter

untitled \*

```
1 # Write your code here :-
2
3 print(2 + 2)
```

Mu 1.0.2 - lec1\_first\_program.py

Mode New Load Save Stop Debug REPL Plotter Zoom-in

Running: lec1\_first\_program.py

```
4
>>>
```

4. see output!

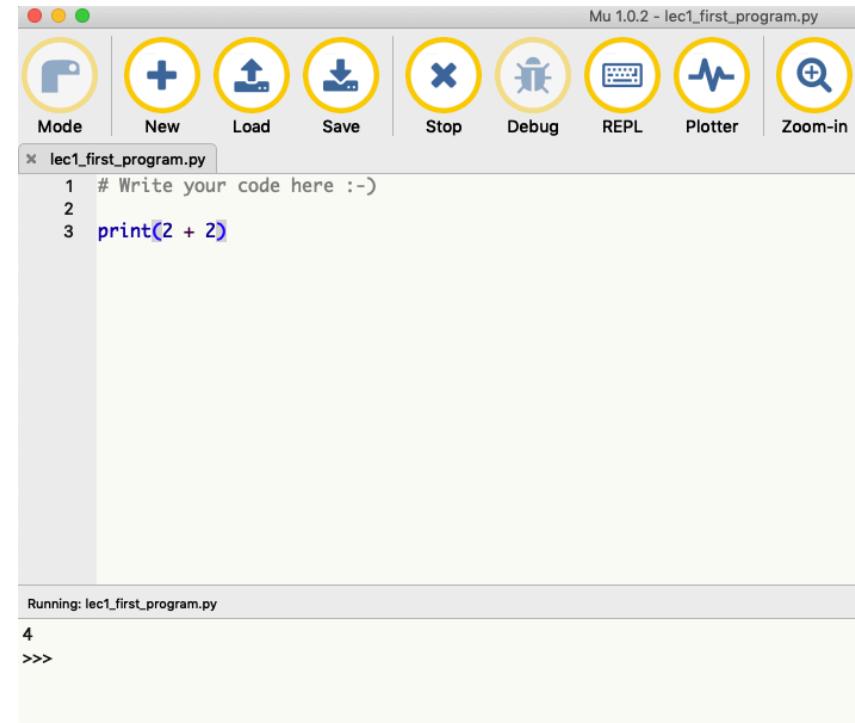

# Why different systems

- Programming in Jupyter notebooks is the not “real programming” that we want to teach you!
- It’s:
  - difficult to share programs
  - difficult to find errors in programs
  - difficult to explain certain concepts
- However:
  - It’s easy to develop step-by-step programs, and share the whole path until you get to result

# An important difference

- Jupyter notebook ‘prints automatically’
- In **mu-editor** you have to say **print(...)** to print the output

```
In [1]: 2 + 2
Out[1]: 4
```

The screenshot shows the Mu Editor interface. At the top, there's a toolbar with icons for Mode (Pencil), New, Load, Save, Stop, Debug, REPL, Plotter, and Zoom-in. The title bar says "Mu 1.0.2 - lec1\_first\_program.py". Below the toolbar is a code editor window titled "lec1\_first\_program.py" containing the following code:

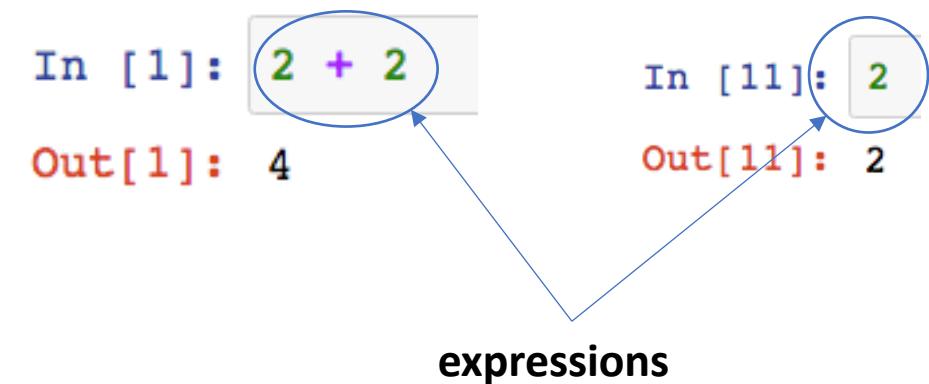

```
1 # Write your code here :-)
2
3 print(2 + 2)
```

At the bottom of the screen, there's a terminal window with the text:

```
Running: lec1_first_program.py
4
>>>
```

# Python 101: What is an Expression?

- “ $2 + 2$ ” is called an **expression**
- Expressions consist of values (here, 2) and operators (here, +)
- Expression can be **evaluated down to a single value**
- Even just writing “2” is an expression, consisting of one value, and no operator.

# Using Python as a Calculator

A “#” starts a comment, which is used to explained code parts.

Operator	Operation	Example Evaluates to...
**	Exponent	<code>2 ** 3</code> 8
%	Modulus/remainder	<code>22 % 8</code> 6
//	Integer division/floored quotient	<code>22 // 8</code> 2
/	Division	<code>22 / 8</code> 2.75
*	Multiplication	<code>3 * 5</code> 15
-	Subtraction	<code>5 - 2</code> 3
+	Addition	<code>2 + 2</code> 4

```
In [1]: 2 + 2 # addition
Out[1]: 4

In [3]: 2 + 3 * 6 # addition and multiplication
Out[3]: 20

In [4]: 124890 * 12415124125 # multiplication of two large numbers
Out[4]: 1550524851971250

In [5]: 2 ** 6 # Compute 2 to the power of 6, i.e.,  $2^6 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$ 
Out[5]: 64

In [6]: 23 / 7 # Divide 23 by 7
Out[6]: 3.2857142857142856

In [7]: 23 // 7 # Divide 23 by 7, round down to an integer number
Out[7]: 3

In [8]: 23 % 7 # What is the remainder of dividing 23 by 7?
Out[8]: 2

In [9]: 2 + 2 # Number of spaces don't carry meaning
Out[9]: 4

In [10]: (5 - 1) * ((7 + 1) / (3 - 1)) # a more complex expression
Out[10]: 16.0
```

# “Evaluated down to a single value?”

```
In [10]: (5 - 1) * ((7 + 1) / (3 - 1))  
Out[10]: 16.0
```

(5 - 1) \* ((7 + 1) / (3 - 1))  
↓  
4 \* ((7 + 1) / (3 - 1))  
↓  
4 \* (( 8 ) / (3 - 1))  
↓  
4 \* ( 8 / 2 )  
↓  
4 \* 4.0  
↓  
16.0

- Order of operations (*precedence*):
  - \*\*, \*, /, //, %, +, -
  - From left to right
- Use parentheses to override the standard precedence

# Errors are okay!

- Programs “crash” if they contain code that the computer doesn’t understand
- Expressions have to be formulated syntactically correct
- Just like in English:
  - “This is a grammatically correct English sentence” vs.
  - “This grammatically is sentence not English correct a”.

```
In [12]: 2 + 3 3
          File "<ipython-input-12-d03b490806c2>", line 1
                  2 + 3 3
                           ^
SyntaxError: invalid syntax

In [13]: 1 * *
          File "<ipython-input-13-7315209b7185>", line 1
                  1 * *
                           ^
SyntaxError: invalid syntax
```

# String concatenation and replication

- We discussed operators such as “+” and “\*” for values that belong to the data type **integers**.
- Straight-forward: Their behavior for **float**.
- But what do they do if string values are involved?

“+”-Operator is not defined for one integer and one string (TypeError).

Operator	Values	Example
+ (concatenate)	Two Strings	'Hello ' + 'Kitty' is 'Hello Kitty'
* (replicate)	One Integer, One String	3 * "Kitten" is "KittenKittenKitten"

```
In [17]: 3 * 'Kitten' + 2
-----
-- 
TypeError
t)
<ipython-input-17-9d5745293635> in 
----> 1 3 * 'Kitten' + 2

TypeError: must be str, not int
```

# Data types

Both 'cat' and "cat" are (the same) strings.

- We have seen “values”
- Data types put values into different categories
- Every value belongs to exactly one data type

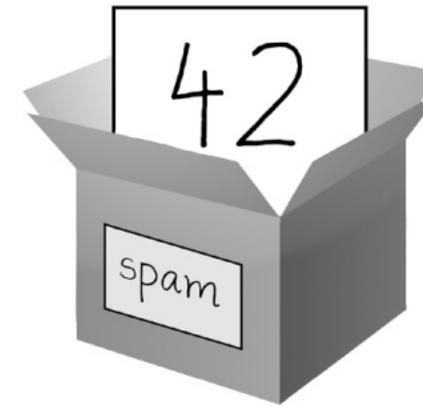

Data type	Examples
Integers (int)	-2, 1, 0, 12314, 20
Floating-point numbers (float)	-1.0, 0.0, 3.14159
Strings	'a', 'one', "zero", '0', 'cat'

```
In [14]: 'This is invalid
          File "<ipython-input-14-91442feb44bd>", line 1
                      'This is invalid'
                                         ^
SyntaxError: EOL while scanning string literal
```

Don't forget to end a string!  
(` is missing)  
Don't mix quotation mark types  
unintentionally.

# Storing Values in Variables

- What if we want to re-use values that we have evaluated before?
- That's what we use **variables** for
- Analogy: A box in your computer memory that can store a value
- Storing a value in a variable is achieved with an assignment statement.
- Syntax: “variable name = value”

```
In [18]: spam = 42
```

```
In [19]: spam
```

```
Out[19]: 42
```

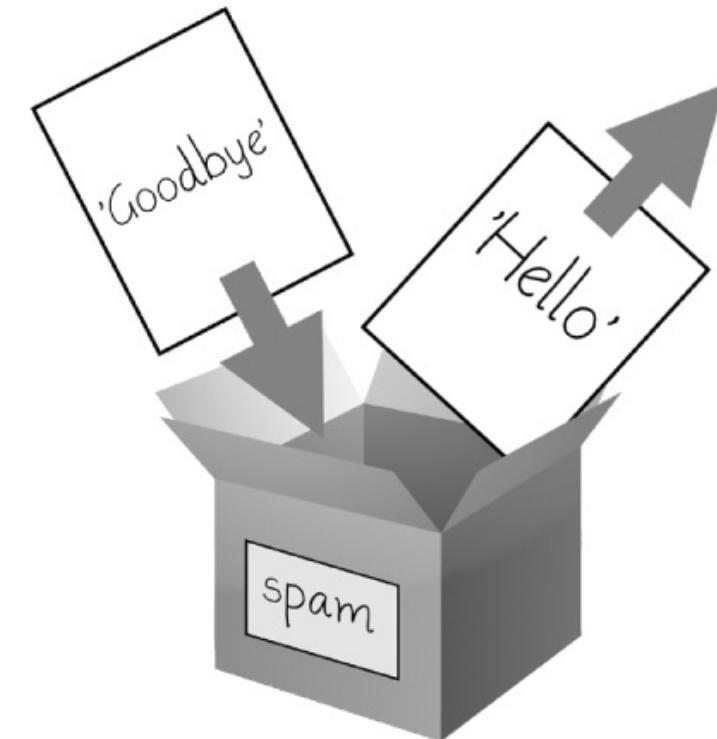

```
In [20]: spam + 2
```

```
Out[20]: 44
```

# Overwriting Variables

- “Hello” (string) is stored in variable spam
- “Goodbye” is stored in variable spam, “Hello” is forgotten

```
In [21]: spam = 'Hello'  
In [22]: spam  
Out[22]: 'Hello'  
  
In [23]: spam = 'Goodbye'  
In [24]: spam  
Out[24]: 'Goodbye'
```

But: Why would you ever want to overwrite a variable?

# Variable Names

- 3 rules a variable name has to obey:
  1. It can only be one word.
  2. It can use only letters, numbers, and the underscore (\_) character.
  3. It cannot begin with a number.
- Variable names are case-sensitive, e.g., “spam” and “Spam” are two different variables
- A good variable name describes the data it contains.

Valid variable names	Invalid variable names
<code>balance</code>	<code>current-balanc</code> (hyphens are not allowed)
<code>currentBalance</code>	<code>current balance</code> (spaces are not allowed)
<code>current_balance</code>	<code>4account</code> (can't begin with a number)
<code>_spam</code>	<code>42</code> (can't begin with a number)
<code>SPAM</code>	<code>total_\$.um</code> (special characters like \$ are not allowed)
<code>account4</code>	<code>'hello'</code> (special characters like ' are not allowed)

# A first program

```
In [27]: # This program says hello and asks for my name.

print('Hello world!')
print('What is your name?')
myName = input()
print('It is good to meet you, ' + myName)
print('The length of your name is:')
print(len(myName))
print('What is your age?')
myAge = input()
print('Next year, you will be ' + str(int(myAge) + 1) + ".")
```

```
Hello world!
What is your name?
Martin
It is good to meet you, Martin
The length of your name is:
6
What is your age?
32
Next year, you will be 33.
```

- Many unknown concepts!
- **Two variables, myName and myAge.** They get a value from something called “input()”.
- We see many strings and some string operations, such as concatenation.
- But what do all the other lines do?

# The *print()* function

We will formally introduce a “function” in the third lecture. For now, think about them as something special.

- *print()* displays the **string value** inside the parentheses on the screen, e.g.,

```
print("Hello world!")
```

displays **Hello world!** on the screen.

- We say that *print* is **called**, the string value in parentheses is **passed** to it.
  - Quotes are not printed, they mark the value as being a string value.

```
In [32]: print("Hello " + 42)
```

```
--  
TypeError                                         Traceback  
t)  
<ipython-input-32-85de8e9ed0c5> in <module>()  
----> 1 print("Hello " + 42)  
  
TypeError: must be str, not int
```

Not a string value => TypeError

# The *input()* function

- The *input()* function waits for the user to input something on the keyboard and press ENTER
- The variable (*name/age*) is then assigned this **string value**

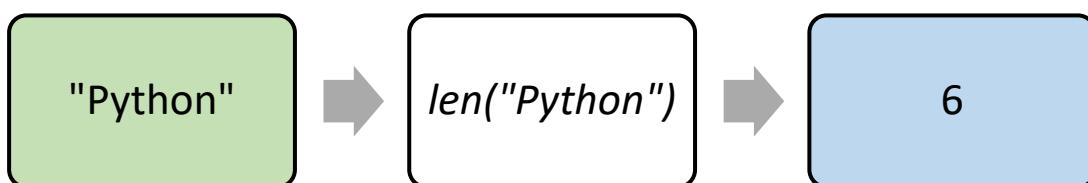

```
In [33]: name = input()
name
Martin
Out[33]: 'Martin'

In [34]: age = input()
print(age + 1)
123
-----
-- 
TypeError
t)
<ipython-input-34-8d17ea96f0aa> in
    1 age = input()
----> 2 print(age + 1)

TypeError: must be str, not int
```

# The *len()* function

- *len()* expects a **string value** and evaluates to the **integer value** of the number of characters in the string

```
In [35]: len("Python")
Out[35]: 6

In [36]: len("This is a very long string!")
Out[36]: 27

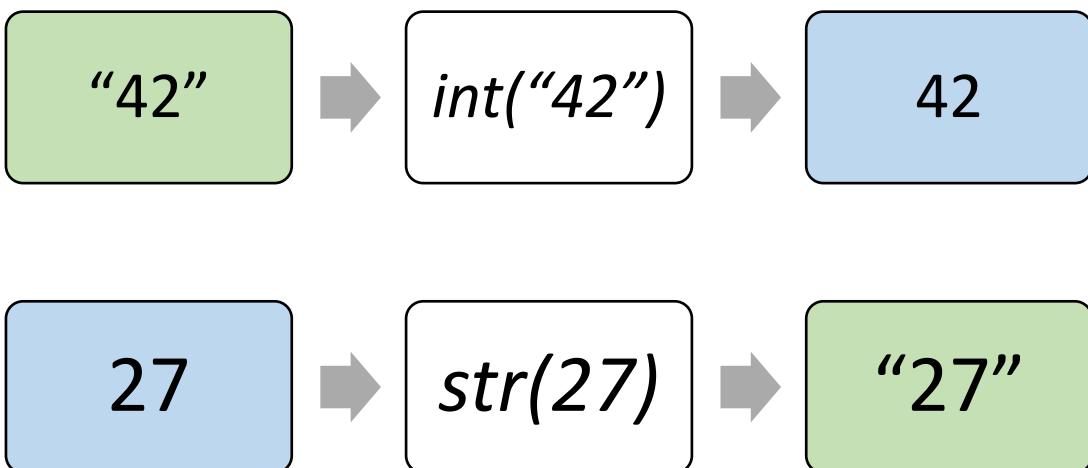

In [37]: len("")
Out[37]: 0

In [38]: len(3.176)
-----
-- Traceback (most recent call last):
--> TypeError: object of type 'float' has no len()
<ipython-input-38-023fe90b9c61> in <module>()
      1 len(3.176)

TypeError: object of type 'float' has no len()
```

# *int(), str(), float()*

- These functions convert between different data types, e.g.,

```
In [40]: age = "27"
next_year = int(age) + 1
print("Next year, you are " + str(next_year) + ".")
```

Next year, you are 28.

```
In [42]: age = "27"
print("Next year, you are" + (age + 1))
```

```
-----
--> TypeError                                         Traceback
t)
<ipython-input-42-f630863a99bd> in <module>()
      1 age = "27"
----> 2 print("Next year, you are" + (age + 1))

TypeError: must be str, not int
```

# This should explain why we wrote...

```
print('You will be ' + str(int(myAge) + 1) + ' in a year.')
print('You will be ' + str(int( '4' ) + 1) + ' in a year.')
print('You will be ' + str(      4 + 1      ) + ' in a year.')
print('You will be ' + str(      5      ) + ' in a year.')
print('You will be ' +      '5'      + ' in a year.')
print('You will be 5'                  + ' in a year.')
print('You will be 5 in a year.'
```

Evaluation steps, if “4” was stored in *myAge*.  
(Slightly different wording in the book.)

# Summary

- Expressions as basic building blocks
  - they consist of values and operators
- Values are split up into categories, we introduced Integers, Floating-point numbers, and Strings
- Variables are used to store values for future usage
- Special functions allow to display text, read user input, and convert values from one data type to another

# Next: Exercises!

- This week: Sharp start at 12:30
- TAs are going to introduce themselves and the general exercise style
- DDI/DDK: 4A14-16
- GBI: Groups 1-7: 4A58
- GBI other groups + guest students: 5A60
- **First priority:** Install Python!
- **Second priority:** Try to solve the exercises
- All information on learnIT!
